1. What this tool does

Every Addressables build can write a **Build Layout report**: a complete description of every bundle, every asset in it, and what references what. It holds the answer to “why is my build so big?”, but it is a JSON file with tens of thousands of lines.

Build Bloat Explorer reads that report and answers the questions directly:

- Which bundles and assets take the most space?
- Which assets are packed into more than one bundle, and how much data do those extra copies add?
- **Why** is a given asset in the build — which scene or prefab, through which material, pulled it in?
- Which Addressables groups cause the duplication, and with which other groups?
- What changed between two builds?

It is an Editor-only tool: nothing is added to your player build, it needs no account or network access, and it only reads report files that are already on your disk.

The Overview tab of a demo project with three levels: 18 assets are packed into more than one bundle.

2. Requirements and installation

Requirement	Details
Unity	6000.3 or newer. Tested: 6000.3.18f1, 6000.4.10f1, 6000.6.2f1 (Windows 11).
Addressables	com.unity.addressables 2.9.1 or newer. Tested: 2.9.1 and 2.11.2. Installed or updated automatically as a dependency.
Platform	Any build target — the tool reads the report, not the bundles. The Editor itself has been tested on Windows; macOS and Linux have not been tested yet.

Install

Import the package from the Asset Store (Package Manager → My Assets). It is installed as the package `com.buildbloatexplorer.addressables` and appears in the Package Manager like any other package. If your project uses an older Addressables version, the Package Manager updates it to 2.9.1.

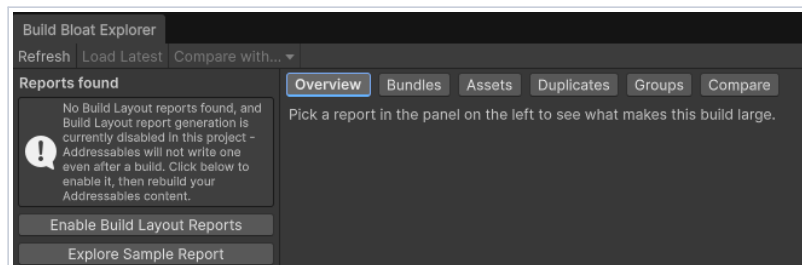

Note. If Addressables is missing or older than 2.9.1 for any reason, the tool does not cause compile errors: its menu item opens a message explaining what to install instead.

Open the window

Window → Addressables → Build Bloat Explorer. The window can be docked like any Editor window.

3. Getting a report

The Build Layout report is **off by default** in Addressables. If the window's report list is empty, that is almost always why. The window detects this and shows an **Enable Build Layout Reports** button that switches the setting on for you. (Manually: **Edit → Preferences → Addressables → *Debug Build Layout***.)

What you see before your first report: the setting is off, with a button to turn it on, and a sample report to look around with in the meantime.

Then build your Addressables content as usual — **Window → Asset Management → Addressables → Groups, Build → New Build → Default Build Script**, or as part of a player build. Every build writes a new report to:

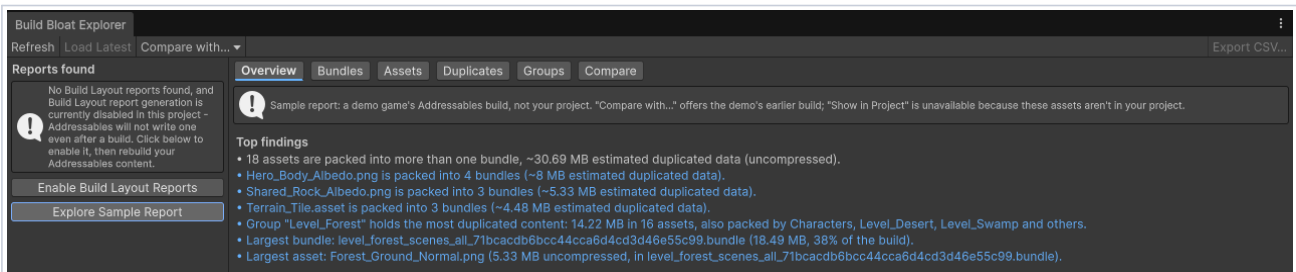

```
Library/com.unity.addressables/BuildReports/buildlayout_<date>.json
```

Reports stay on your machine (the Library folder isn't in source control). Keep the older ones: they are what you compare against later.

Tip. Writing the report adds a little time to every Addressables build. Turn it off again in the Addressables preferences if you only analyse occasionally.

Try it first with the sample report

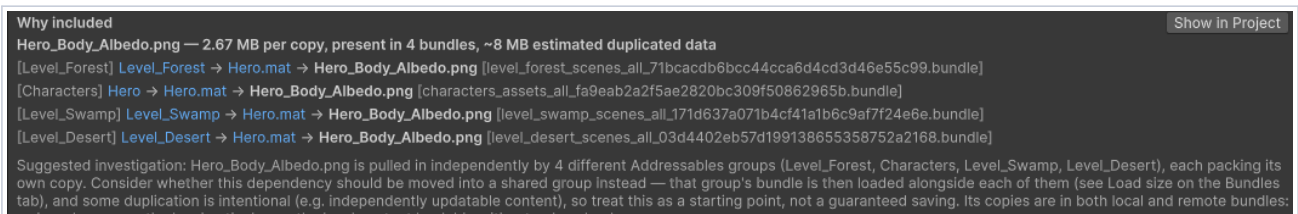

Explore Sample Report (shown while your project has no reports) loads two builds of a small demo game that ship with the tool: three levels, 48 MB, 18 assets packed into more than one bundle. Every tab works, and **Compare with...** offers the demo's earlier build. A banner reminds you that it isn't your project; **Show in Project** is disabled because the demo's assets aren't in it. Once your own first report exists, the button disappears and your reports are listed instead.

The sample report loaded: the banner marks it as demo data.

4. Quick start: find your biggest waste in five minutes

- **Load Latest** in the toolbar opens your newest report.
- Read the **Top findings** on the Overview. The first line tells you how much data is duplicated across bundles; the next ones name the worst assets.
- Click the first asset finding. The **Duplicates** tab opens with that asset selected, and the bottom panel shows one chain per copy: which group, scene, prefab and material pulled it in.
- Open the **Groups** tab to see which groups hold the duplicated content and which other groups they share it with.
- Decide on a fix (usually: move the shared dependency into its own group), rebuild, and use **Compare with... → Previous build** to confirm what changed.

The “Why included” panel for a texture packed into 4 bundles: one chain per copy and a suggested investigation that names the groups involved.

5. The window

Build Bloat Explorer

Why included Show in Project

Hero_Body_Albedo.png — 2.67 MB per copy, present in 4 bundles, ~8 MB estimated duplicated data

[Level_Forest] [Level_Forest](#) → [Hero.mat](#) → [Hero_Body_Albedo.png](#) [level_forest_scenes_all_71bcacdb6bcc44cca6d4cd3d46e55c99.bundle]
 [Characters] [Hero](#) → [Hero.mat](#) → [Hero_Body_Albedo.png](#) [characters_assets_all_fa9eab2a2f5ae2820bc309f50862965b.bundle]
 [Level_Swamp] [Level_Swamp](#) → [Hero.mat](#) → [Hero_Body_Albedo.png](#) [level_swamp_scenes_all_171d637a071b4cf41a1b6c9af7f24e6e.bundle]
 [Level_Desert] [Level_Desert](#) → [Hero.mat](#) → [Hero_Body_Albedo.png](#) [level_desert_scenes_all_03d4402eb57d199138655358752a2168.bundle]

Suggested investigation: Hero_Body_Albedo.png is pulled in independently by 4 different Addressables groups (Level_Forest, Characters, Level_Swamp, Level_Desert), each packing its own copy. Consider whether this dependency should be moved into a shared group instead — that group's bundle is then loaded alongside each of them (see Load size on the Bundles tab), and some duplication is intentional (e.g. independently updatable content), so treat this as a starting point, not a guaranteed saving. Its copies are in both local and remote bundles: a shared group on the local paths keeps the local content loadable without a download.

The window in the light Editor skin. Left: the reports found. Top: toolbar and tabs. Bottom: the details panel for the current selection.

Area	What it does
Reports found	Every report on disk, newest first. Click one to load it; the loaded one is highlighted. The window reloads it after a script recompile.
Refresh / Load Latest	Rescan the report folder / load the newest report.
Compare with...	Compare the loaded report with another one (section 11).
Export CSV...	Save the rows of the current table (section 12).
Tabs	Overview, Bundles, Assets, Duplicates, Groups, Compare.
Bottom panel	“Why included” for an asset, or “Bundle details” for a bundle. Drag the divider to resize it.

All tables sort by clicking a column header and filter with the search field above them. Long names are shortened with “...” — asset paths from the start, so the file name stays visible; hover a cell for its full value.

6. Overview

Top findings lists, in plain language: how much data is duplicated, the three worst duplicated assets, the group holding the most duplicated content, the largest bundle (with its share of the build), a bundle whose dependencies cost more to load than the bundle itself, bundles built without compression, local bundles that need a remote download, and the largest asset. Findings only appear when they apply. Click a finding to jump to it.

Size by asset type splits the asset data by type — textures, meshes, audio... — with each type's share, how many assets and copies it has, and how much of it is duplicated. Click a type to list just those assets.

Below that are the build's key numbers: total size, bundle count, how much of the build **ships with the player** and how much is **downloaded** (local / remote), asset counts, duplicated assets, estimated wasted bytes, and which Unity/Addressables version and build target produced the report.

Note. Asset sizes are **uncompressed** (as stored before bundle compression); the total build size is the **compressed** bundle files on disk. That is why the tool never shows duplicated data as a percentage of the build size — see section 13.

Assets/Showcase/Textures/Shared_Rock_Normal.png	Texture2D	level_desert_scenes_all_03d...	via Level_Desert	Yes	1.33 MB	
Assets/Showcase/Textures/Hero_Body_Albedo.png	Texture2D	characters_assets_all_fa9ea...	via Characters	Yes	2.67 MB	
Assets/Showcase/Textures/UI_MainMenu_Background.png	Texture2D	ui_assets_all_b7a2c96929b...	via UI	Yes	2.67 MB	
Assets/Showcase/Textures/Hero_Body_Albedo.png	Texture2D	level_forest_scenes_all_71bc...	via Level_Forest	Yes	2.67 MB	
Assets/Showcase/Textures/Swamp_Mud_Albedo.png	Texture2D	level_swamp_scenes_all_171...	via Level_Swamp	Yes	2.67 MB	
Assets/Showcase/Textures/Hero_Body_Albedo.png	Texture2D	level_swamp_scenes_all_171...	via Level_Swamp	Yes	2.67 MB	
Assets/Showcase/Textures/Hero_Body_Albedo.png	Texture2D	level_desert_scenes_all_03d...	via Level_Desert	Yes	2.67 MB	

Clicking “Texture2D” in the Overview lists only textures in the Assets tab. “Show all” removes the filter.

7. Bundles

Every bundle with its group, compressed size on disk, **load size**, number of explicit (directly addressable) assets, compression, **delivery** and whether it is Unity's built-in bundle. Sorted by size by default.

Delivery comes from the load path the build recorded for the bundle: **Local** bundles are built into the player, **Remote** bundles are downloaded from an http(s) URL at runtime, and **Custom** means another load path (for example your own runtime variable) that the report alone can't classify. Bundle details show the full path under "Loaded from". If a local bundle depends on a remote one, a Top finding points it out: loading that local content needs a download first, which is easy to miss until the game is started offline.

A bundle built without compression shows “Uncompressed” and gets a Top finding: in a test build the same content was 31 KB uncompressed against 5 KB with LZ4. It is sometimes deliberate (faster loading), so the finding only asks you to check the group's Compression setting.

Load size is the bundle plus every bundle it depends on, directly or through other bundles: Addressables loads all of them before an asset from this bundle can be used. It is an upper bound for one load, since bundles that are already loaded are not loaded again. It is the other side of fixing duplication: moving shared assets into their own group removes copies but adds that group's bundle to the load size of every bundle that uses it.

Select a bundle to see **Bundle details**: its largest assets, which of its assets also have a copy in another bundle, the bundles it depends on (Addressables loads those whenever it loads this one) and the bundles that depend on it, followed by the full load-size list. Asset names jump to the asset, bundle names to that bundle.

Bundle details for the Characters bundle: its texture and material also have copies in other bundles.

8. Assets and “Why included”

The Assets tab lists every asset **occurrence**: an asset packed into three bundles appears three times, once per bundle. Implicit assets — pulled in as a dependency rather than added to a group — show “Yes” in the Implicit column and “via <group>” as their group: the group whose bundle packed that copy.

Select any asset to see why it is included. The panel shows the chain from a root — a scene or an asset you added to a group — down to the selected asset, for example:

```
[Level_Forest] Level_Forest → Hero.mat → Hero_Body_Albedo.png
[level_forest_scenes_all_....bundle]
```

- The name in square brackets at the start is the Addressables group of the root — the group whose settings decide how this copy is packed.
- Every blue link is clickable: it selects that asset and shows *its* chain.
- The bundle this copy lives in is shown at the end.
- If the copy is referenced directly by several assets, a line under the chain lists all of them (first eight, then “+N more”; hover for the rest). Assets that only reach it through another listed asset — a prefab that uses a texture via its material — are left out.
- **Show in Project** (or double-click the row) selects the asset in the Project window. It is disabled, with the reason in its tooltip, for Unity built-in resources and assets that aren't in the open project.

Why included

Show in Project

[Props] [Barrel](#) → [unity_built_in_extra](#) [e15a6670b5300c7e956f536a6d9183fc_unitybuiltinassets_0c4f8259e60924b66d64e976ceb134c3.bundle]

Referenced directly by 7 assets: [Barrel](#), [Crate](#), [Hero](#), [Level_Desert](#), [Level_Forest](#), [Level_Swamp](#), [UI_MainMenu](#)

Unity's built-in resources (unity_built_in_extra) are referenced directly by 7 assets; each name is a link.

Note. A chain shows one representative route. An asset can be reachable through several; the “Referenced directly by” line lists all direct referrers, but longer alternative routes are not drawn.

9. Duplicates

Assets packed into more than one bundle: path, type, size per copy, number of bundles, and the **estimated wasted** bytes, sorted worst first.

$$\text{estimated wasted} = \text{size per copy} \times (\text{number of copies} - 1)$$

Select a row for a summary, one chain per copy (so you see the different route each copy took into the build) and a **suggested investigation**. When the copies come from different groups, the note names them.

Why included Show in Project

Hero_Body_Albedo.png — 2.67 MB per copy, present in 4 bundles, ~8 MB estimated duplicated data

[Level_Forest] Level_Forest → Hero.mat → Hero_Body_Albedo.png [level_forest_scenes_all_71bcacdb6bcc44cca6d4cd3d46e55c99.bundle]

[Characters] Hero → Hero.mat → Hero_Body_Albedo.png [characters_assets_all_fa9eab2a2f5ae2820bc309f50862965b.bundle]

[Level_Swamp] Level_Swamp → Hero.mat → Hero_Body_Albedo.png [level_swamp_scenes_all_171d637a071b4cf41a1b6c9af7f24e6e.bundle]

[Level_Desert] Level_Desert → Hero.mat → Hero_Body_Albedo.png [level_desert_scenes_all_03d4402eb57d199138655358752a2168.bundle]

Suggested investigation: Hero_Body_Albedo.png is pulled in independently by 4 different Addressables groups (Level_Forest, Characters, Level_Swamp, Level_Desert), each packing its own copy. Consider whether this dependency should be moved into a shared group instead — that group's bundle is then loaded alongside each of them (see Load size on the Bundles tab), and some duplication is intentional (e.g. independently updatable content), so treat this as a starting point, not a guaranteed saving. Its copies are in both local and remote bundles:

Duplicates in the demo project. The hero texture is referenced by the Characters group and, through prefab instances saved in each scene, by every level.

Tip. Why does an addressable prefab still get duplicated? A prefab instance saved in a scene references the prefab's materials directly, so each scene bundle packs its own copy of the material and textures — even though the prefab itself is in another group. The demo above shows exactly this: follow the chain.

When the copies are in both local and remote bundles, the suggestion adds that a shared group on the local paths keeps the local content loadable without a download.

Important. Some duplication is deliberate — for example content that must be downloadable independently. The suggestion is a starting point for investigation, not a guaranteed saving.

10. Groups

The same duplicates rolled up per Addressables group — the unit whose settings you change. For each group that holds at least one copy of a duplicated asset: packing mode, number of duplicated assets and copies, the size of those copies (*Duplicated content*) and the groups it shares duplicates with.

- “Duplicated content” is the size of every copy the group holds, not the saving: that depends on which copy you keep. Use the Duplicates tab’s estimate for savings.
- “Shared with: itself” means the group has copies in two of its own bundles — usually its packing mode (Pack Separately). In the demo, the Props group does this with its wood texture.
- Sharing with other groups usually points at a common dependency that could live in a shared group.
- Select a group to list the duplicated assets with a copy in it (“Show all” returns to the full list).

Overview	Bundles	Assets	Duplicates	Groups	Compare
Groups whose bundles contain copies of duplicated assets. “Duplicated content” is the size of every copy the group holds, not the amount that could be saved – see the Duplicates tab for estimated waste per asset. A group that duplicates within itself usually points at its packing mode; one that shares duplicates with other groups usually points at a dependency that could live in a shared group. Some duplication is intentional. Select a group to list its duplicated assets.					
Group	Packing mode	Dup. assets	Copies	Duplicated content	Duplicates shared with
Level_Forest	PackTogether	16	16	14.22 MB	Characters, Level_Desert, Level_Swamp, UI
Level_Swamp	PackTogether	16	16	14.22 MB	Characters, Level_Desert, Level_Forest, UI
Level_Desert	PackTogether	15	15	13.12 MB	Characters, Level_Forest, Level_Swamp, UI
Characters	PackTogether	2	2	2.67 MB	Level_Desert, Level_Forest, Level_Swamp
Props	PackSeparately	2	4	1.34 MB	itself
UI	PackTogether	1	1	12.38 KB	Level_Desert, Level_Forest, Level_Swamp

The three level groups share most of their duplicated content with each other.

Overview	Bundles	Assets	Duplicates	Groups	Compare

Assets/Showcase/Materials/Rock_Shared.mat	Material	908 B	3	1.77 KB	level_forest_scenes_all_71bcacdb6bcc44c...
Assets/Showcase/Materials/Water.mat	Material	904 B	3	1.77 KB	level_forest_scenes_all_71bcacdb6bcc44c...
Assets/Showcase/Materials/UI_Icons.mat	Material	904 B	3	1.77 KB	level_forest_scenes_all_71bcacdb6bcc44c...

After selecting a group, the Duplicates tab lists only that group’s duplicated assets.

11. Comparing two builds

With a report loaded, **Compare with...** lists the other reports; the first entry is the previous build. The Compare tab shows the change in total size and estimated duplicated data, every bundle with its old and new size, and every asset whose total size or number of copies changed. Select an asset to see why it is included in the newer build.

Overview Bundles Assets Duplicates Groups **Compare**

Older: buildlayout_2026.09.26.08.37.02.json (built 26.09.2026 08:37)
 Newer: buildlayout_2026.09.26.08.37.20.json (built 26.09.2026 08:37)
 Total size +13.18 MB (35.12 MB → 48.3 MB). Estimated duplicated data +14.22 MB. Bundles: 1 added, 0 removed, 0 changed. Assets changed: 19.

Bundles

Bundle (hash removed)	Status	Old size	New size	Change	Delivery
level_swamp_scenes_all.bundle	Added		13.18 MB	+13.18 MB	Remote
characters_assets_all.bundle	Unchanged	2.02 MB	2.02 MB	0 B	Local

Assets/Showcase/Audio/Ambience_Wind.wav	Changed	2 → 3	1.58 MB	+539.07 KB
Assets/Showcase/Audio/UI_Click.wav	Changed	3 → 4	49.5 KB	+12.38 KB

Why included Show in Project

[Level_Forest] Level_Forest → Shared_Rock_Albedo.png [level_forest_scenes_all_71bcacdb6bcc44cca6d4cd3d46e55c99.bundle]
 [Level_Swamp] Level_Swamp → Shared_Rock_Albedo.png [level_swamp_scenes_all_171d637a071b4cf41a1b6c9af7f24e6e.bundle]
 [Level_Desert] Level_Desert → Shared_Rock_Albedo.png [level_desert_scenes_all_03d4402eb57d199138655358752a2168.bundle]

Adding a third level added a 13 MB bundle and a third copy of the shared rock texture (2 → 3 copies).

- Bundles are matched by name without Addressables' content hash, so a bundle whose content changed shows as "Changed", not as removed + added.
- Projects using the "Only Hash" bundle naming mode have no stable names: changed bundles appear as removed + added.
- A bundle that moved between local and remote shows as "Changed" with "Local → Remote" (or the reverse) in the Delivery column, even if its size is the same.
- The comparison stays selected when scripts recompile.

12. Exporting to CSV

Export CSV... saves the rows the current tab shows — with your search, filter and sort order — as a CSV file. Sizes are raw byte counts so a spreadsheet can sum and sort them; lists inside a cell are separated by semicolons; files are UTF-8 with a byte-order mark so Excel reads non-ASCII paths correctly. On the Compare tab it asks whether to export the bundle changes or the changed assets.

13. Understanding the numbers

Number	Meaning
Total build size	Sum of the bundle files on disk — compressed, as players download them.
Asset size	Serialized + streamed data of an asset (texture pixels, audio samples...), uncompressed. Comparable between assets, not with bundle sizes.
Estimated wasted	Size per copy × (copies – 1): what one copy of each duplicated asset would save, uncompressed. The download saving is smaller after compression and may be zero if the copies serve independent downloads.
Duplicated content (Groups)	Size of every copy a group holds — not a saving.
Local / remote	Bundle files built into the player vs downloaded from a URL, from each bundle's load path.
Explicit assets	Assets you added to a group. Implicit assets are pulled in by them.

Duplicate detection works per asset: an asset counts as duplicated when it is packed into more than one bundle. Unity's own report also lists duplication per object inside an asset; on every real report we tested, the two lists name the same assets in the same bundles.

14. Troubleshooting

Problem	What to do
The report list is empty	Report generation is off: click Enable Build Layout Reports in the window, then build Addressables content again.
An error instead of the report (“Report file is empty.”, “Failed to parse report JSON...”, “File does not contain recognizable Addressables Build Layout data.”)	The file is incomplete or not a Build Layout report — e.g. the build was interrupted. Rebuild Addressables content and load the new report.
A newer build doesn't appear	Click Refresh .
The loaded report disappeared after Refresh	Its file no longer exists — a clean build or a deleted Library folder removes old reports.
Show in Project is disabled	The asset is a Unity built-in resource, or it isn't in this project (e.g. it was deleted since the build). The tooltip says which.
Menu item only shows a message	Addressables is missing or older than 2.9.1 — install/update it in the Package Manager.
Loading a very large report takes a few seconds	Expected for tens of thousands of assets (~3 s for 55,000 asset occurrences on the test machine); files of 10 MB or more show a progress bar.

15. Known limitations

- Tested on Windows only; macOS and Linux Editors are untested.
- Tested with Unity 6000.3, 6000.4 and 6000.6 and Addressables 2.9.1 and 2.11.2. Earlier versions are not supported.
- Chains show one representative route per copy (direct referrers are all listed).
- “Only Hash” bundle naming can't be matched between builds.
- Local / remote is read from each bundle's load path; custom runtime load paths show as “Custom”.

16. Support

Email compassandcircle@gmail.com. Please include your Unity and Addressables versions and, if you can, the `buildlayout_*.json` file the problem occurs with — it contains asset paths and names from your project but no asset content.

Website and online manual: <https://efs24test-del.github.io/supplycrate.github.io/> (SupplyCrate).
